

Request for Results of All Stardust Sample (Comet Wild-2) Analyses

We are in the process of updating and altering the Stardust Sample Database to provide an accessible, searchable format, as an aid to community in making informed sample requests. To make this feature possible requires the cooperation of the community. We request that you complete the following information sheet (see below) on each sample that has been allocated to you, no later than six (6) months after receipt of the sample. We have found that we cannot search photos with embedded text and data, so please separate such text from any images and report the images separately. We realize that this is a lot of work for you, but this task is necessitated by the unique nature of the Wild-2 samples.

We are extending this request to data gathered during Stardust Preliminary Examination (PET). We will begin this process by placing all of the data gathered during sample PET into the on-line database around May 15, and then proceed through the post PET period up to the present date. It is our goal to keep this database current, so that future workers can mine the maximum information from the Wild-2 samples, and make informed sample requests.

Thank you for your cooperation.
